**Overview**
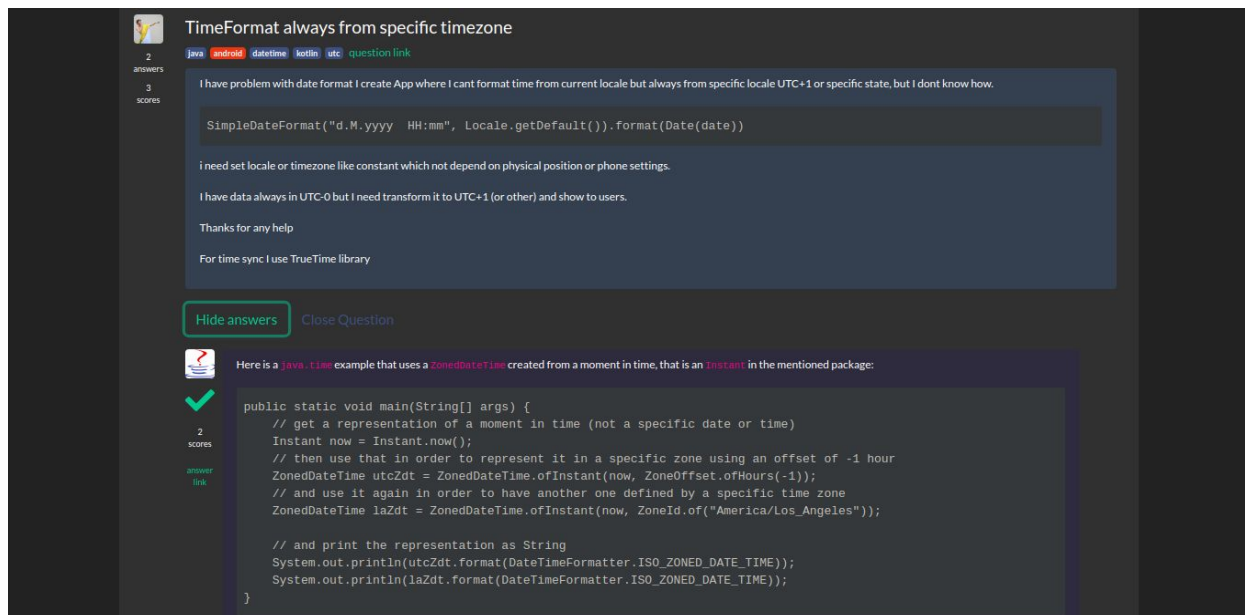

Stackoverdroid is a minimal website keeping track of the 10 newest and the 10 most voted Android-related questions. (and more…)

Here is an overview of the website:

You can navigate in between the top voted and the latest questions by the navigation buttons.

You can click on each title to see the full body of the question, and if you're interested, you can see the answers and the discussions related to the question by clicking on the green-colored `Show answers` button. The discussions will fade in. If you want to find out even more about each question or answer, you can click on the links to the related Stackoverflow pages (as shown below)

You can scroll down to see other answers and related comments as well.

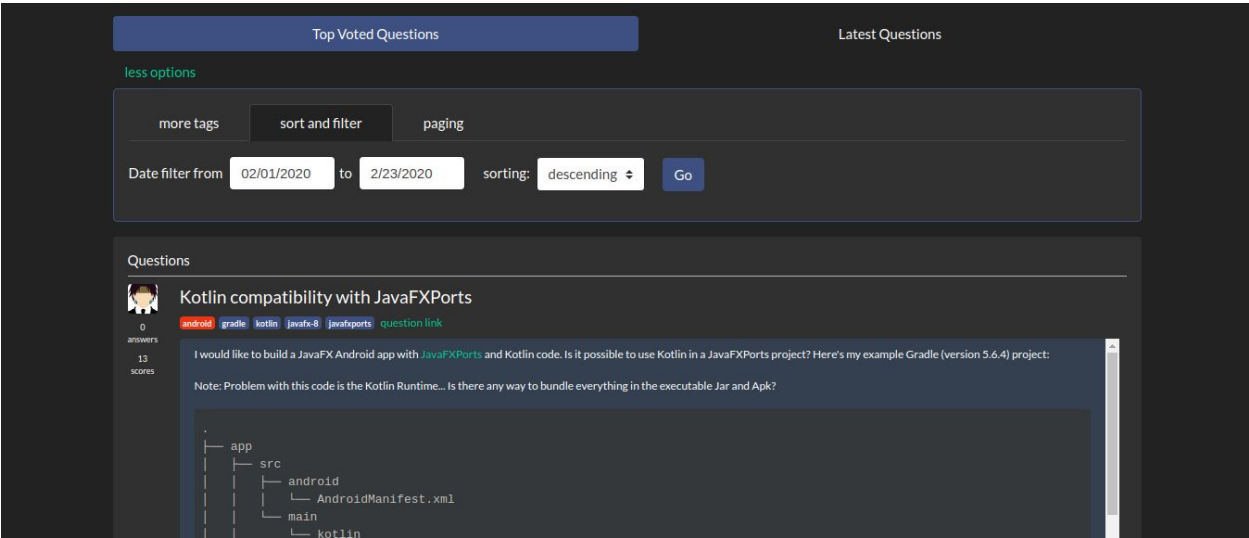

Additional feature:

If you're browsing the top voted and the latest questions and you don't like what you're seeing, you can easily find out more about other related questions by adding more options.

Simply click on the `more options` link:

In the first tab, you can add any number of tags you want to filter the questions. Let's say you'd like to see questions that are also related to `Kotlin`. Here is how you do it:

If you want to see the top voted questions of the past month or any other time period, you can easily change the date filter:

And if you want to see more questions on one page and see other pages as well, use the third tab:

The website is pretty smooth and easy to work with. I strongly recommend running and testing it in addition to reading this document.

Thank you for your time :)
